ABSTRACT

In our previous work titled “Riemannian Quantum Theory of a Particle in a Finite-Potential Well”, we constructed the Riemannian Laplacian operator and used it to obtain the Riemannian Schrodinger equation for a particle in a finite-potential well. In this work, we solved the golden Riemannian Schrodinger equation analytically to obtain the particle energy. The solution resulted in two expressions for the energy of a particle in a finite-potential well. One of the expressions is for the odd energy levels while the other is for the even energy levels.

Keywords: Energy; finite-potential; quantum theory; particle; schrodinger equation.
1. INTRODUCTION

The origin of quantum physics occupies a time period in history that covers a quarter of a century. Classical or Newtonian mechanics was available in the powerful formulations of Lagrange and Hamilton by the year 1900. Thus, the classical electromagnetic theory was embodied in the differential equations of Maxwell. Defects were, however, made clear by the failure of the classical theories to explain some experimental results, notably, the frequency dependence of the intensity of radiation emitted by a blackbody, the photoelectric effect and the stability and size of atoms [1].

Quantum Physics came to existence in 1900 when a famous pronouncement was put forward by Planck to unfold and illustrate the meaning of the observed properties of the radiation ejected by a blackbody [2]. This phenomenon posed an unsolved problem to theoretical physicists for several decades.

Principles of thermodynamics and electromagnetism had been applied to the problem but, these classical methods had failed to give a sensible explanation of the experimental results [3,4].

The quantum hypothesis of Planck and the subsequent interpretation of the idea by Einstein in 1905 gave electromagnetic radiation discrete properties; somewhat similar to those of a particle. The quantum theory made provision for radiation to have both wave and particle aspects in a complementary form of coexistences. The theory was extended when a matter was found to have wave characteristics as well as particle properties by de Broglie in 1923 [5]. These notions continued to evolve until 1925 when the formal apparatus of quantum theory came into being.

The discovery of the wave-like behaviour of an electron created the need for a wave theory describing the behavior of a particle on the atomic scale. This theory was proposed by Schrödinger in the year 1926, two years after de Broglie formulated the idea of a particle-wave nature [6]. Schrödinger reasoned that if an electron behaves as a wave, then it should be possible to mathematically describe the behavior of the electrons in space-time coordinate as a wave.

The Schrödinger proposed theory; yielded the fundamental equation of quantum mechanics known as the Schrödinger wave equation. This equation has the same central importance to quantum mechanics as Newton’s law of motion has for classical mechanics [7].

2. THEORETICAL ANALYSIS

2.1 Derivation of Riemannian Laplacian Operator in Spherical Polar Coordinate Based upon the Golden Metric Tensor

Consider a particle of mass, \( m \) in a finite-potential well of width, \( a \) and depth, \( V_0 \).

The Riemannian Laplacian operator [8,9] is given by

\[
\nabla^2_r = \frac{1}{\sqrt{g}} \frac{\partial}{\partial x^\mu} \left( \sqrt{g} g^{\mu\nu} \frac{\partial}{\partial x^\nu} \right)
\]

where \( g_{\mu\nu} \equiv \text{metric} \) and \( g = \text{determinant of } g_{\mu\nu} \)

The Golden Riemannian metric tensors in spherical polar coordinate [9,10] are given by

\[ g_{11} = \left( 1 + \frac{2}{c^2} f \right)^{-1} \]
\[ g_{22} = r^2 \left( 1 + \frac{2}{c^2} f \right)^{-1} \]
\[ g_{33} = r^2 \sin^2 \theta \left( 1 + \frac{2}{c^2} f \right)^{-1} \]
\[ g_{00} = - \left( 1 + \frac{2}{c^2} f \right) \]
\[ g_{\mu\nu} = 0; \text{otherwise} \]

and

\[ g = r^4 \sin^2 \theta \left( 1 + \frac{2}{c^2} f \right)^{-2} \]
\[ \sqrt{g} = r^2 \sin \theta \left( 1 + \frac{2}{c^2} f \right)^{-1} \]

From equation (1) we have:

\[
\nabla^2_r = \frac{1}{\sqrt{g}} \frac{\partial}{\partial x^1} \left( \sqrt{g} g^{11} \frac{\partial}{\partial x^1} \right) + \frac{1}{\sqrt{g}} \frac{\partial}{\partial x^2} \left( \sqrt{g} g^{22} \frac{\partial}{\partial x^2} \right) + \frac{1}{\sqrt{g}} \frac{\partial}{\partial x^3} \left( \sqrt{g} g^{33} \frac{\partial}{\partial x^3} \right) + \frac{1}{\sqrt{g}} \frac{\partial}{\partial x^0} \left( \sqrt{g} g^{00} \frac{\partial}{\partial x^0} \right)
\]

If we let

\[ \alpha = \frac{1}{\sqrt{g}} \frac{\partial}{\partial x^1} \left( \sqrt{g} g^{11} \frac{\partial}{\partial x^1} \right) \]
\[ \beta = \frac{1}{\sqrt{g}} \frac{\partial}{\partial x^2} \left( \sqrt{g} g^{22} \frac{\partial}{\partial x^2} \right) \]
\[ \gamma = \frac{1}{\sqrt{g}} \frac{\partial}{\partial x^3} \left( \sqrt{g} \cdot g^{33} \frac{\partial}{\partial x^3} \right) \]
and
\[ \xi = \frac{1}{\sqrt{g}} \frac{\partial}{\partial x^2} \left( \sqrt{g} \cdot g^{00} \frac{\partial}{\partial x^3} \right) \]

Equation (9) reduces to
\[ \nabla^2_k = \alpha + \beta + \gamma + \xi \quad (10) \]

For \( \alpha = \frac{1}{\sqrt{g}} \frac{\partial}{\partial x^3} \left( \sqrt{g} \cdot g^{11} \frac{\partial}{\partial x^3} \right) \)
\[ = \frac{1}{r^2 \sin \theta} \left( 1 + \frac{2}{c^2} f \right) \frac{\partial}{\partial r} \left( r^2 \sin \theta \frac{\partial}{\partial r} \right) \]
\[ = \frac{r^2 \sin \theta}{1 + \frac{2}{c^2} f} \frac{\partial}{\partial r} \left( r^2 \frac{\partial}{\partial r} \right) \]
\[ = \frac{1}{\alpha} \left( 1 + \frac{2}{c^2} f \right) \frac{\partial}{\partial r} \left( r^2 \frac{\partial}{\partial r} \right) \quad (12) \]

For \( \beta = \frac{1}{\sqrt{g}} \frac{\partial}{\partial x^2} \left( \sqrt{g} \cdot g^{22} \frac{\partial}{\partial x^2} \right) \)
\[ = \frac{1}{r^2 \sin \theta} \left( 1 + \frac{2}{c^2} f \right) \frac{\partial}{\partial \theta} \left( r^2 \sin \theta \frac{\partial}{\partial \theta} \right) \]
\[ = \frac{r^2 \sin \theta}{1 + \frac{2}{c^2} f} \frac{\partial}{\partial \theta} \left( r^2 \frac{\partial}{\partial \theta} \right) \]
\[ = \frac{1}{\alpha} \left( 1 + \frac{2}{c^2} f \right) \frac{\partial}{\partial \theta} \left( r^2 \frac{\partial}{\partial \theta} \right) \quad (14) \]

For \( \gamma = \frac{1}{\sqrt{g}} \frac{\partial}{\partial x^3} \left( \sqrt{g} \cdot g^{33} \frac{\partial}{\partial x^3} \right) \)
\[ = \frac{1}{r^2 \sin \theta} \left( 1 + \frac{2}{c^2} f \right) \frac{\partial}{\partial \phi} \left( r^2 \sin \theta \frac{\partial}{\partial \phi} \right) \]
\[ = \frac{r^2 \sin \theta}{1 + \frac{2}{c^2} f} \frac{\partial}{\partial \phi} \left( r^2 \frac{\partial}{\partial \phi} \right) \quad (15) \]

To obtain \( \alpha \) in spherical polar coordinate, we substitute equations (2) and (7) into equation (11) as follows:
\[ a = \frac{1}{\sqrt{g}} \frac{\partial}{\partial x^3} \left( \sqrt{g} \cdot g^{11} \frac{\partial}{\partial x^3} \right) = \]
\[ = \frac{1}{r^2 \sin \theta} \left( 1 + \frac{2}{c^2} f \right) \frac{\partial}{\partial r} \left( r^2 \sin \theta \frac{\partial}{\partial r} \right) \]
\[ = \frac{r^2 \sin \theta}{1 + \frac{2}{c^2} f} \frac{\partial}{\partial r} \left( r^2 \frac{\partial}{\partial r} \right) \]
\[ = \frac{1}{\alpha} \left( 1 + \frac{2}{c^2} f \right) \frac{\partial}{\partial r} \left( r^2 \frac{\partial}{\partial r} \right) \quad (12) \]

Substituting equations (12), (14), (16) and (18) into equation (10), we have thus:
\[ \nabla^2_k = \frac{1}{r^2} \left( 1 + \frac{2}{c^2} f \right) \frac{\partial}{\partial r} \left( r^2 \frac{\partial}{\partial r} \right) \]
\[ + \frac{1}{r^2 \sin \theta} \left( 1 + \frac{2}{c^2} f \right) \frac{\partial}{\partial \theta} \left( \sin \theta \frac{\partial}{\partial \theta} \right) \]
\[ - \frac{1}{r^2 \sin \theta \cos \theta} \left( 1 + \frac{2}{c^2} f \right) \frac{\partial}{\partial \phi} \left( \frac{\partial}{\partial \phi} \right) \quad (19) \]

Equation (19) is the golden Riemannian Laplacian operator in the spherical polar coordinate. The well-known Laplacian operator is derived based on Euclidean geometry while equation (19) is derived based on the Riemannian geometry using the golden metric tensor. This equation is further applied to the Schrodinger equation in order to obtain the golden Riemannian Schrodinger equation.

### 2.2 Derivation of golden Riemannian Schrodinger equation in Spherical Polar Coordinate

Consider the well-known Schrodinger equation [11,12] given by
\[ E \psi = H \psi = -\frac{\hbar^2 \psi^2}{2m} + V(r) \psi \quad (20) \]

where \( E \) is energy of the particle, \( H \) is Hamiltonian of the system, \( m \) is mass of the particle, \( \hbar \) is normalised Planck’s constant, \( \nabla^2 \) is Euclidean Laplacian of the system, \( V \) is particle potential and \( \psi \) is wave function.

We replace the Euclidean Laplacian operator with the golden Riemannian Laplacian operator in equation (19); that is:
\[ E \psi = H \psi = -\frac{\hbar^2 \psi^2}{2m} + V(r) \psi \quad (21) \]
Substituting the expression for the Riemannian Laplacian operator, $\nabla^2$ into equation (21), we obtain

$$H \psi = -\frac{h^2}{2m} \left( \frac{1+2f}{c^2} \frac{\partial}{\partial r} \left( r^2 \frac{\partial}{\partial r} \right) + \frac{1}{r^2 \sin \theta} \left( 1 + \frac{2f}{c^2} \right) \frac{\partial}{\partial \theta} \left( \sin \theta \frac{\partial}{\partial \theta} \right) + \frac{1}{r^2 \sin^2 \theta} \left( 1 + \frac{2f}{c^2} \right) \frac{\partial}{\partial \phi} \left( \frac{\partial}{\partial \phi} \right) \right) - 1 + 2c^2f - 1/\hbar \partial x \partial \psi \partial x \partial \psi \right)_{r, t} + V(r, t, \theta, \phi, x^0)$$

(22)

Expanding equation (22) and considering that $V = V_0$ which is the depth of the potential well, we obtain

$$i\hbar \left( \frac{\partial}{\partial \theta} \psi(r, \theta, \phi, x^0) - \frac{h^2 \eta}{2m^2 \sin^2 \theta} \frac{\partial^2}{\partial \theta^2} \psi(r, \theta, \phi, x^0) \right) - \frac{h^2 \eta}{2m^2 \sin \theta} \frac{\partial^2}{\partial \phi^2} \psi(r, \theta, \phi, x^0)$$

$$= \frac{h^2 \eta}{2m^2 \sin \theta \sin^2 \theta} \frac{\partial^2}{\partial \phi^2} \psi(r, \theta, \phi, x^0) + \frac{h^2 \eta}{m^2 \sin \theta} \frac{\partial^2}{\partial \phi^2} \psi(r, \theta, \phi, x^0) + V_0 \psi(r, t, \theta, \phi, x^0)$$

(23)

where

$$\eta = \left( 1 + \frac{2}{c^2} f \right)$$

(24)

Equation (23) is the golden Riemannian Schrodinger equation in spherical polar coordinates.

Using the method of separation of variables, we seek to express the wave function, $\psi$ as

$$\psi = R(r) \Phi(\phi) \Theta(\theta) \exp \left( \frac{iEt}{\hbar} \right)$$

(25)

Putting equation (25) into (23) yields

$$- \frac{\hbar^2}{2m} \left( \frac{d^2}{dr^2} + r^{-2} \frac{d}{dr} r^{-2} \frac{d}{dr} \right) R + \frac{\hbar^2}{2m} \left( \frac{d^2 \Phi}{d\phi^2} \right) + \frac{\hbar^2}{m^2 \sin \theta} \left( \frac{d^2 \Theta}{d\theta^2} \right) - \frac{\hbar^2 \eta}{m \exp \frac{iEt}{\hbar}} R \Phi(\phi) \Theta(\theta)$$

(26)

Dividing equation (26) by (25) and bringing the like terms together we have

$$E = - \frac{\hbar^2 \eta}{R(r)m} \frac{d^2 R(r)}{dr^2} - \frac{\hbar^2}{2} \left( \frac{d^2 \Phi}{d\phi^2} \right) - \frac{\hbar^2}{2m^2 \sin \theta \sin \theta} \left( \frac{d^2 \Theta}{d\theta^2} \right)$$

(27)

Rearranging equation (27) we have

$$- \frac{1}{2} \frac{\hbar^2 \eta}{R(r)m} \left( \frac{d^2 R(r)}{dr^2} \right) - \frac{\hbar^2}{2} \Theta(\theta) \sin^2 \theta \sin \theta - V_0 = - \frac{1}{2} \Theta(\theta) \sin \theta \sin \theta - \frac{\hbar^2 \eta}{2} \left( \frac{d^2 \Phi}{d\phi^2} \right) - \frac{\hbar^2}{2} \Theta(\theta) \sin \theta \sin \theta$$

(28)

Equating the left hand side of equation (28) to $-\lambda^2$ implies that

$$- \frac{1}{2} \frac{\hbar^2 \eta}{R(r)m} \left( \frac{d^2 R(r)}{dr^2} \right) - \frac{\hbar^2}{2} \Theta(\theta) \sin^2 \theta \sin \theta + V_0 - E = - \frac{1}{2} \Theta(\theta) \sin \theta \sin \theta - \frac{\hbar^2 \eta}{2} \left( \frac{d^2 \Phi}{d\phi^2} \right) - \frac{\hbar^2}{2} \Theta(\theta) \sin \theta \sin \theta$$

(29)

Multiplying through equation (29) by $- \frac{2mR(r)}{\hbar^2 \eta}$

$$\frac{d^2 R(r)}{dr^2} + \frac{2}{r} \frac{d R(r)}{dr} + \frac{2mR(r)}{\hbar^2 \eta} = \frac{2mR(r)\hbar^2 \eta}{\hbar^2 \eta} + \frac{2mR(r)E}{\hbar^2 \eta} = \frac{2mR(r)\lambda^2}{\hbar^2 \eta}$$

(30)
From equation (45) we have
\[ \frac{d^2}{dr^2} R(r) + \frac{2}{r} \left( \frac{d}{dr} R(r) \right) - \frac{\mathscr{R}_r k^2}{\hbar^2 \eta^2} - \frac{2mR(r)\mathcal{V}_0}{\hbar^2 \eta} + \frac{2mR(r)\mathcal{E}}{\hbar^2 \eta} - \frac{2mR(r)\lambda^2}{\hbar^2 \eta} = 0 \]
(31)

Equation (31) becomes
\[ \frac{d^2}{dr^2} R(r) + \frac{2}{r} \left( \frac{d}{dr} R(r) \right) - \frac{1}{\hbar^2 \eta} \left( \frac{\mathscr{R}_r k^2}{\eta} + 2m\mathcal{V}_0 - 2m\mathcal{E} + 2m\lambda^2 \right) R(r) = 0 \]
(32)

From equation (32)
\[ \frac{d^2 R}{dr^2} + 2 \frac{dR}{dr} - \frac{1}{\hbar^2 \eta} \left( \frac{\mathscr{R}_r k^2}{\eta} + 2m\mathcal{V}_0 - 2m\mathcal{E} + 2m\lambda^2 \right) R = 0 \]
(33)

Let \( R = a_0 + a_1 r + a_2 r^2 + a_3 r^3 + \cdots + a_k r^k \)
(34)

Thus,
\[ R = \sum_{k=0}^\infty a_k r^k \]
(35)
\[ R' = \sum_{k=1}^\infty k a_k r^{k-1} \]
(36)
\[ R'' = \sum_{k=2}^\infty k(k-1) a_k r^{k-2} \]
(37)

Substituting equations (35) to (37) into (33) we have
\[ \sum_{k=2}^\infty k(k - 1) a_k r^{k-2} + 2r^{-1} \sum_{k=1}^\infty k a_k r^{k-1} - \tau \sum_{k=0}^\infty a_k r^k = 0 \]
(38)

Where \( \tau = \frac{1}{\hbar^2 \eta} \left( \frac{\mathscr{R}_r k^2}{\eta} + 2m\mathcal{V}_0 - 2m\mathcal{E} + 2m\lambda^2 \right) \)
(39)

This implies that
\[ \sum_{k=2}^\infty k(k - 1) a_k r^{k-2} + 2\sum_{k=1}^\infty k a_k r^{k-2} - \sum_{k=0}^\infty \tau a_k r^k = 0 \]
(40)

Shifting the first term of equation (40) yields
\[ \sum_{k=0}^{(k+2)} (k+1) a_{k+2} r^k + \sum_{k=0}^{(k+2)} 2(k+2) a_{k+2} r^k - \sum_{k=0}^{(k+2)} \tau a_k r^k = 0 \]
(41)
\[ \sum_{k=0}^{(k+2)} ((k+2)(k+1) + 2(k+2)) a_{k+2} r^k - \sum_{k=0}^{(k+2)} \tau a_k r^k = 0 \]
(42)
\[ \{(k+2)(k+1) + 2(k+2)) a_{k+2} - \tau a_k = 0 \]
(43)

It implies that
\[ \{(k+2)(k+3) a_{k+2} - \tau a_k = 0 \]
(44)

and
\[ a_{k+2} = \frac{\tau a_k}{(k+2)(k+3)} \; ; k = 0,1,2,3 \ldots \]
(45)

From equation (45) we have
\[ a_2 = \frac{\tau a_0}{3!} \; ; k = 0 \]
(46)
Rearranging we have

\[ a_3 = \frac{\tau a_1}{3x^4}; k = 1 \]  

\[ a_4 = \frac{\tau^2 a_0}{5!}; k = 2 \]  

\[ a_5 = \frac{\tau^2 a_1}{6x5x4x^3}; k = 3 \]  

\[ a_6 = \frac{\tau^2 a_0}{5!}; k = 4 \]  

\[ a_7 = \frac{\tau^2 a_1}{8x7x6x5x4x3}; k = 5 \]  

Substituting equations (46) to (51) into (34) we have

\[ R = a_0 + a_1 r + \frac{\tau a_0 r^2}{3!} + \frac{\tau a_1 r^3}{3x4} + \frac{\tau^2 a_0 r^4}{5!} + \frac{\tau^2 a_1 r^5}{6x5x4x3} + \frac{\tau^3 a_0 r^6}{7!} + \frac{\tau^3 a_1 r^7}{8x7x6x5x4x3} + \ldots \]  

\[ R = \left(a_0 + \frac{\tau a_0 r^2}{3!} + \frac{\tau^2 a_0 r^4}{5!} + \frac{\tau^2 a_1 r^5}{6x5x4x3} + \frac{\tau^3 a_1 r^7}{8x7x6x5x4x3}\right) + \ldots \]  

Therefore,

\[ R(r) = \frac{c_1}{r} \exp(-\sqrt{r})r + \frac{c_2}{r\sqrt{r}} \exp(\sqrt{r})r \]  

Substituting for \( r \) we have

\[ R(r) = \frac{c_1}{r} \exp \left\{-\frac{1}{\hbar^2} \left( \frac{E^2}{\eta} + 2mV_0 - 2mE + 2m\lambda^2 \right)^{\frac{1}{2}} r + \frac{c_2}{\left( \frac{1}{\hbar^2} \left( \frac{E^2}{\eta} + 2mV_0 - 2mE + 2m\lambda^2 \right)^{\frac{1}{2}} \right)^{\frac{3}{2}} r \right\} \exp \left\{ \frac{1}{\hbar^2} \left( \frac{E^2}{\eta} + 2mV_0 - 2mE + 2m\lambda^2 \right) \right\} \]  

Solving equation (55) for \( E \), we obtain

\[ E = \frac{1}{r} \left\{ m\eta r + \left( m^2 \eta^2 r^2 + \ln \left( \frac{R(r) + \sqrt{R(r)^2 + 4c_1^2}}{c_1} \right) \right)^{\frac{1}{2}} \right\} \]  

Also equating the right hand side of equation (28) to \(-\lambda^2\) implies that

\[- \frac{\hbar^2 \eta \cos \theta}{2\eta \theta \sin \theta} \left( \frac{d}{d\theta} \Theta(\theta) \right) - \frac{\hbar^2 \eta}{2\theta \sin \theta} \left( \frac{d^2}{d\theta^2} \Theta(\theta) \right) - \frac{\hbar^2 \eta}{2\Phi(\phi) \sin \theta} \left( \frac{d^2}{d\phi^2} \Phi(\phi) \right) = -\lambda^2 \]  

Multiplying through equation (57) by \(-\frac{2m\lambda^2}{\hbar^2 \eta}\), we obtain

\[ \frac{\cos(\theta)}{\Theta(\theta) \sin(\theta)} \frac{d^2}{d\theta^2} \Theta(\theta) + \frac{\Phi(\phi)}{\Phi(\phi) \sin \theta^2} \left( \frac{d^2}{d\phi^2} \Phi(\phi) \right) = 2m\lambda^2 \frac{\hbar^2 \eta}{h^2 \eta} \]  

Rearranging we have

\[ \frac{\cos(\theta)}{\Theta(\theta) \sin(\theta)} \frac{d^2}{d\theta^2} \Theta(\theta) + \frac{\Phi(\phi)}{\Phi(\phi) \sin \theta^2} \left( \frac{d^2}{d\phi^2} \Phi(\phi) \right) \left( \frac{d^2}{d\phi^2} \Phi(\phi) \right) - 2m\lambda^2 = 0 \]  

\[ (55) \]
Equivalently

\[
\frac{\cos(\theta)}{\Phi(\theta) \sin(\theta)} \frac{d^2 \Phi(\theta)}{d\theta^2} + \left( \frac{d^2 \Phi(\theta)}{d\theta^2} - \frac{2mr^2\lambda}{\hbar^2} \right) = - \left( \frac{d^2 \Phi(\phi)}{d\phi^2} \right) \Phi(\phi) \sin^2 \theta \tag{60}
\]

Equating the left hand side of equation (61) to \(- k\) implies that

\[
\frac{\cos(\theta)}{\Theta(\theta) \sin(\theta)} \frac{d^2 \Theta(\theta)}{d\theta^2} + \left( \frac{d^2 \Theta(\theta)}{d\theta^2} - \frac{2mr^2\lambda}{\hbar^2} \right) = -k \tag{61}
\]

Multiplying through equation (61) by \(\Theta(\theta)\) gives

\[
\frac{\cos(\theta)}{\sin(\theta)} \frac{d^2 \Theta(\theta)}{d\theta^2} - \frac{2\Theta(\theta)mr^2\lambda}{\hbar^2} = -\Theta(\theta)k \tag{62}
\]

From equation (62) we have

\[
\frac{d^2 \Theta}{d\theta^2} + \frac{\cos \theta}{\sin \theta} \frac{d\Theta}{d\theta} + \left( k - \frac{1}{\hbar^2} (2mr^2\lambda^2) \right) \Theta = 0 \tag{63}
\]

Let \(q = k - \frac{1}{\hbar^2} (2mr^2\lambda^2)\)

Equation (64) becomes

\[
\frac{d^2 \Theta}{d\theta^2} + \frac{\cos \theta}{\sin \theta} \frac{d\Theta}{d\theta} + q\Theta = 0 \tag{65}
\]

Using same method of obtaining equation (56) we have

\[
\Theta(\theta) = c_1 \left\{ 1 - \frac{\rho^2}{21} (6 - \rho) \rho^4 - \frac{\rho}{61} (20 - \rho)(6 - \rho) \rho^6 \right\} + c_2 \left\{ \rho + \frac{1}{33}(2 - \rho)\rho^2 + \frac{1}{33}(12 - \rho)(2 - \rho)\rho^7 \right\} \tag{66}
\]

Equating the right hand side of equation (60) to \(- k\) implies that

\[- \frac{d^2 \Phi(\phi)}{d\phi^2} = -k \tag{67}\]

Multiplying through by \(\Phi(\phi) \sin^2 \theta\) we have

\[
\frac{d^2 \Phi(\phi)}{d\phi^2} \Phi(\phi) - \Phi(\phi)(\sin^2 \theta)k = 0 \tag{68}\]

From equation (68)

\[
\frac{d^2 \Phi}{d\phi^2} - \Phi \sin^2 \theta k = 0 \tag{69}\]

This implies that

\[
\frac{d^2 \Phi}{d\phi^2} - k \sin^2 \theta \Phi = 0 \tag{70}\]

The characteristic equation is given by

\[
m^2 - k \sin^2 \theta = 0 \tag{71}\]
and
\[ m = \pm \sqrt{k \sin^2 \theta} = \pm \sqrt{k \sin \theta} \] (72)

Hence,
\[ \Phi(\phi) = c_1 \exp(\sqrt{k}(\sin \theta) \phi) + c_2 \exp(-\sqrt{k}(\sin \theta) \phi) \] (73)

Seeking the solution for equation (73) as
\[ \frac{1}{r} \left[ -2m(\lambda^2 + E - V_0)(\eta + E) \right]^{1/2} = n\pi \] (74)

\[ \left( -\frac{1}{\hbar^2} 2m(-\lambda^2 + E - V_0)\eta + E^2 \right)^{1/2} - n\pi = 0 \] (75)

Solving for \( E \) from equation (75) yields
\[ E = \eta m + \sqrt{\eta^2 \hbar^2 n \pi^2 + \lambda^2 m^2 - 2\eta m \lambda^2 - 2V_0 \eta m} \]
\[ E = \eta m - \sqrt{\eta^2 \hbar^2 n \pi^2 + \lambda^2 m^2 - 2\eta m \lambda^2 - 2V_0 \eta m} \] (76)

From equation (76) we have two sets of values for the energy which are identified as
\[ E_1 = \eta m + \sqrt{\eta^2 \hbar^2 n \pi^2 + \lambda^2 m^2 - 2\eta m \lambda^2 - 2V_0 \eta m} \] (77)

and
\[ E_2 = \eta m - \sqrt{\eta^2 \hbar^2 n \pi^2 + \lambda^2 m^2 - 2\eta m \lambda^2 - 2V_0 \eta m} \] (78)

Substituting the expression for \( \eta \) from equation (24) into equations (77) and (78) we have
\[ E_1 = \left( 1 + \frac{2}{c^2} f \right) m + \sqrt{\left( 1 + \frac{2}{c^2} f \right)^2 \hbar^2 n \pi^2 + \left( 1 + \frac{2}{c^2} f \right)^2 \lambda^2 m^2 - 2\left( 1 + \frac{2}{c^2} f \right) m \lambda^2 - 2V_0 \left( 1 + \frac{2}{c^2} f \right) m} \] (79)

and
\[ E_2 = \left( 1 + \frac{2}{c^2} f \right) m - \sqrt{\left( 1 + \frac{2}{c^2} f \right)^2 \hbar^2 n \pi^2 + \left( 1 + \frac{2}{c^2} f \right)^2 \lambda^2 m^2 - 2\left( 1 + \frac{2}{c^2} f \right) m \lambda^2 - 2V_0 \left( 1 + \frac{2}{c^2} f \right) m} \] (80)

Further simplification and expansion of equations (79) and (80) gives
\[ E_n (\text{for odd } n) = m + \frac{2fm}{c^2} + \left( n\pi^2 \hbar^2 - 4n^2 \frac{\hbar^2 f^2}{c^2} + \frac{4mn^2 \hbar^2 f^2}{c^4} + m^2 - \frac{4m^2 f^2}{c^2} + \frac{4m^2 f^2}{c^4} - 2m \lambda^2 + \frac{4m^2 f^2}{c^2} - 2V_0 m + \frac{4V_0 mf}{c^2} \right) \frac{1}{2} \] (81)

and
\[ E_n (\text{for even } n) = m + \frac{2fm}{c^2} - \left( n\pi^2 \hbar^2 - 4n^2 \frac{\hbar^2 f^2}{c^2} + \frac{4mn^2 \hbar^2 f^2}{c^4} + m^2 - \frac{4m^2 f^2}{c^2} + \frac{4m^2 f^2}{c^4} - 2m \lambda^2 + \frac{4m^2 f^2}{c^2} - 2V_0 m + \frac{4V_0 mf}{c^2} \right) \frac{1}{2} \] (82)

where \( n \) is energy level of the particle in a finite potential well, \( m \) is the mass of the particle, \( c \) is speed of light, \( V_0 \) is depth of the well, \( f \) is gravitational scalar potential, \( h \) is normalised Planck's constant \( \pi \) and \( \lambda \) are constants.

3. DISCUSSION

Equation (81) and (82) are the solutions to the golden Riemannian Schrodinger equation. They represent the quantum energies of the particle in a finite-potential well. Equation (81) represents the energy at odd energy levels and equation (82) represents the energy at even energy levels.

This can also be applied to all entities of non-zero rest mass such as: infinite potential well, a rectangular potential well, simple harmonic oscillator etc.

4. REMARKS AND CONCLUSION

We have in this article, showing how to formulated and constructed the Riemannian
Laplacian operator and the golden Riemannian Schrodinger equation. We have solved the golden Riemannian Schrodinger equation analytically and obtained the expressions for the quantum energies for both odd and even states.
